The PCB will:
• connect all sensors
• distribute power
• support the microcontroller
• connect the data logger
• include LED status indicators
This replaces the original breadboard and shield configuration.

7 Proposed system architecture

8 Component selection strategy
• prioritize currently available modules
• prioritize low-cost parts
• prioritize easy Arduino/KiCad integration
• reduce design risk by using proven breakout modules

9 Past chosen components vs new components

10 Advantages of the new design
Benefits of the redesigned payload:
• reduced wiring complexity
• smaller and lighter electronics
• lower risk of connection failures
• easier system integration
• improved reliability during flight

11 The end
Thank you

Advantages of the new design

Benefits of the redesigned payload:

- reduced wiring complexity
- smaller and lighter electronics
- lower risk of connection failures
- easier system integration
- improved reliability during flight
